 Solutions for Tutorial 4

Readings: AIMA Chapter 5

1. Consider the AC-3(csp) algorithm (reproduced below), can the last line “add (X_k, X_i) to queue” be replaced with “if $X_k \neq X_j$ then add (X_k, X_i) to queue”? Justify your answer.

```

function AC-3(csp) returns the CSP, possibly with reduced domains
inputs: csp, a binary CSP with variables  $\{X_1, X_2, \dots, X_n\}$ 
local variables: queue, a queue of arcs, initially all the arcs in csp

while queue is not empty do
   $(X_i, X_j) \leftarrow \text{REMOVE-FIRST}(\textit{queue})$ 
  if REMOVE-INCONSISTENT-VALUES( $X_i, X_j$ ) then
    for each  $X_k$  in NEIGHBORS[ $X_i$ ] do
      add  $(X_k, X_i)$  to queue
  
```

```

function REMOVE-INCONSISTENT-VALUES( $X_i, X_j$ ) returns true iff succeeds
  removed  $\leftarrow$  false
  for each  $x$  in DOMAIN[ $X_i$ ] do
    if no value  $y$  in DOMAIN[ $X_j$ ] allows  $(x, y)$  to satisfy the constraint  $X_i \leftrightarrow X_j$ 
      then delete  $x$  from DOMAIN[ $X_i$ ]; removed  $\leftarrow$  true
  return removed
  
```

Yes.

Case (1): (X_j, X_i) has not been processed. In this case, (X_j, X_i) is in queue and there is no need to add it.

Case (2): (X_j, X_i) has been processed and some domain value(s) of X_i has just been removed. None of the deleted values x_i in the domain of X_i is such that there is some value x_j in the domain of X_j and (x_i, x_j) satisfy the constraint between X_i and X_j . Hence there is no need to add the arc (X_j, X_i) to queue, since there is no x_j that can be removed because of the removal of the just deleted x_i .

2. Consider the following constraint satisfaction problem:

Variables:

$$A, B, C$$

Domains:

$$D_A = D_B = D_C = \{0, 1, 2, 3, 4\}$$

Constraints:

$$A = B + 1$$

$$B = 2C$$

Construct a constraint graph for this problem. Show a trace of the AC-3 algorithm on this problem. Assume that initially, the arcs in queue are in the order $\{(A, B), (B, A), (B, C), (C, B)\}$.

Constraint Graph:

Original domains:

$$D_A = D_B = D_C = \{0, 1, 2, 3, 4\}$$

Content of queue and domain of variables at the end of each iteration:

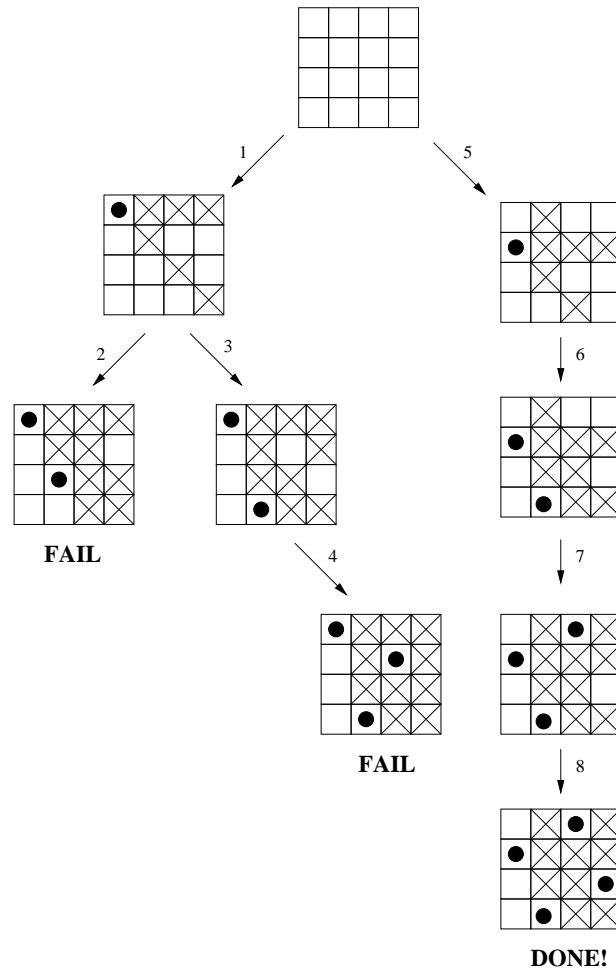

<i>New DV</i>	<i>queue</i>
	$(A, B) (B, A) (B, C) (C, B)$
$D_A = \{1, 2, 3, 4\}$	$(B, A) (B, C) (C, B)$
$D_B = \{0, 1, 2, 3\}$	$(B, C) (C, B)$
$D_B = \{0, 2\}$	$(C, B) (A, B)$
$D_C = \{0, 1\}$	(A, B)
$D_A = \{1, 3\}$	

Allowable domain values:

$$\begin{aligned} D_A &= \{1, 3\} \\ D_B &= \{0, 2\} \\ D_C &= \{0, 1\} \end{aligned}$$

3. Consider the 4-queens problem on a 4×4 chess board. Suppose the leftmost column is column 1, and the topmost row is row 1. Let Q_i denote the row number of the queen in column i , $i = 1, 2, 3, 4$. Assume that variables are assigned in the order Q_1, Q_2, Q_3, Q_4 , and the domain values of Q_i are tried in the order 1, 2, 3, 4. Show a trace of the backtracking algorithm with forward checking to solve the 4-queens problem.

The following is the trace of the search tree:

4. Show a trace of the backtracking algorithm with forward checking to solve the cryptarithmic problem shown in Figure 1. Use the most constrained variable heuristic, and assume that the domain values (digits) are tried in ascending order (i.e., 0, 1, 2, ...).

Figure 1: Cryptarithmic puzzle.

The following is the trace:

Assignments								Remarks
$X1=0$	$X2=0$	$X3=0$						$X1, X2, X3$ are the most constrained variables. $X3=0$ forces $F=0$, which is not possible.
		$X3=1$	$F=1$	$T=2$				T is the most constrained variable, with domain = $\{2,9\}$, whereas the remaining variables have domain = $\{0,2,9\}$. $T=2$ results in no satisfying value for O .
				$T=3$				$T=3$ results in no satisfying value for O .
				$T=4$				$T=4$ results in no satisfying value for O .
				$T=5$	$O=0$			$T=5$ uniquely determines the value for O . Fail since R has no satisfying value.
				$T=6$	$O=2$	$R=4$	$W=0$	$T=6$ uniquely determines the value for O and R . Fail since there is no satisfying value for U .
							$W=3$	Fail since there is no satisfying value for U .
							$W=5$	Fail since there is no satisfying value for U .
							$W=7$	Fail since there is no satisfying value for U .
							$W=8$	Fail since there is no satisfying value for U .
								Fail since there is no satisfying value for U .
				$T=7$	$O=4$	$R=8$	$W=0$	uniquely determines the value for O and R . Fail since there is no satisfying value for U .
							$W=2$	Fail since there is no satisfying value for U .
							$W=3$	$U=6$ Succeeds!
